

**Ruby still wants to
be your best friend**

Why this talk?

The time when I started
doing **technical**
interviews

XSS

SQL injection

Authentication

Authorisation

REST principles

Rails app, **nothing to
do here...**

I take **Rails** for
granted

We are all **human**

Community is
important

But Rails is **fucking**
slow

I still build stupid apps for
startups that **nobody**
cares about.

Because **Javascript**
performs better!

What do I look for in a framework?

- respect from community
 - bleeding edge
- speed and efficiency

Why not **Node.js**
based framework?

Well, I could work in
PHP as well then

Is this what I **should** be
look for in a framework?

- respect from community
 - bleeding edge
- speed and efficiency

I love programming,
but **job is a job**

What should I be
looking for?

Less stress

More money

Rails is great for this

Ruby was built for
developers...

...it's not perfect, but **it**
cares about you...

...and still wants to be
your **best friend**.
